Roll NO-13

### Chart-1

It is a Regional comparison across four cities.

- > Delhi  $\rightarrow$  about 735
- > Vizag  $\rightarrow$  about 713
- > Chennai  $\rightarrow$  about 737
- > Kolkata  $\rightarrow$  about 700

Y-axis labelled football ('000's) so these values represent thousands

\* It shows Chennai & Delhi have highest football figures while Kolkata has lowest

### Chart-2

- > It shows how app usage is distributed across 9 categories
- > Each slice represents one category's share of total app usage

> The purple, green, blue sections appear relatively large, while some categories have smaller shares

The basic proportions can be understood but:

- > The categories aren't labelled
- > Exact percentages aren't provided
- > Similar sized slices are difficult to compare

### Chart - 3

It compares two variables over time

• coffee consumption increases

• productivity score also increases

Both lines are generally moving upward.

It is trying to tell us is "Higher coffee consumption is associated with higher productivity."

Therefore, the chart shows that coffee consumption and productivity move upward together, but it does not prove that drinking more coffee cause higher productivity.

### Chart - 4

This is scatter plot.

X-axis → Study Hours

Y-axis → Exam score

• each dot → one observation of student

most probably points are widely scattered around the middle.

⊕ It is trying to show whether students who study more hours tend to get higher exam scores

⇒ There appears to be some positive relationship but it is not very strong because the points are widely spread.

However, we should not conclude that study hours alone determine exam performance
