15/10/26 Activity 6: Sankey_website_Flow

R.NO: 13 Name: Dudekula Mohammad Ilyas - 192325017

a) Hidden flows

Rule: Incoming flow = Outgoing flow

1. Genre → Compare prices = 2040 - 767 - 670 = 603
2. Compare prices → Order placed = 2610 - 592 - 1521 = 497
3. Mobile app link → Author page = 2166 - 605 - 654 = 907

b) Calculations

i) Conversion rate

$$\frac{2001}{6370} \times 100 = 31.41\%$$

ii) Largest labelled flow into NO order or Exit site = 1647 sessions

iii) Author page → compare prices

$$\frac{643}{2051} \times 100 = 31.35\%$$

c) Four design decisions

1. Node order: Arrange stages from traffic sources to outcome.
2. Colours: Use different colours for orders & exits
3. Labels: Show clear names and flow values
4. Highlight: Highlight orders to show successful purchases.

d) Node heights

formula = Height = Sessions ÷ 300

Author Page = 2051 ÷ 300 = 6.84 cm

Best Seller page = 2279 ÷ 300 = 7.60 cm

Genere Page = 2040 ÷ 300 = 6.80 cm

e) R code:

```
library(ggplot2)
library(ggalluvial)
ggplot(df, aes(axis1 = source, axis2 = landing,
               y = Sessions)) +
  geom_alluvium() +
  geom_stratum() +
  geom_text(stat = "stratum",
            aes(label = after_stat(stratum))) +
  scale_x_discrete(limits = c("source", "Landing")) +
  theme_minimal()
```

f) Two limitations

1. Too many flows cause confusion. Alternative: Bar chart
2. Small flows are hard to read. Alternative: labelled chart table.
